Jacqueline Habegger

# Organo-SOMO catalysis

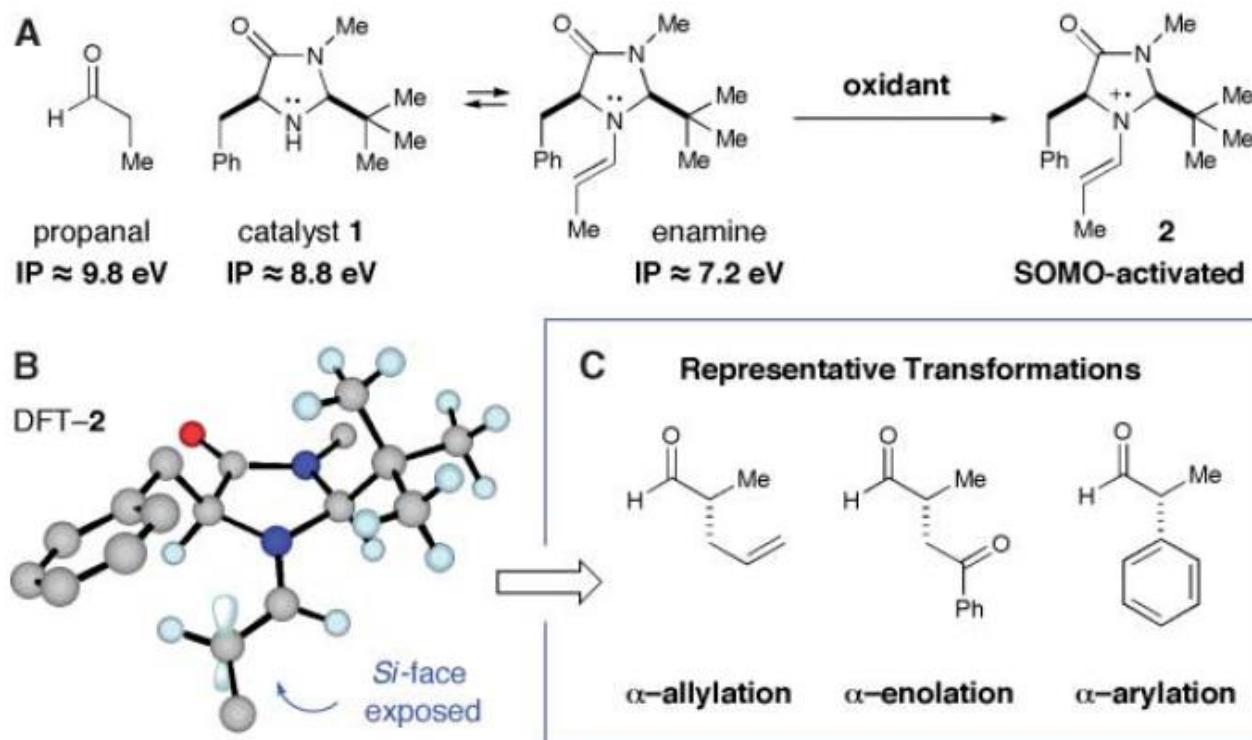

**Fig. 1.** SOMO catalysis via single-electron oxidation of a transiently formed enamine. LUMO, lowest unoccupied molecular orbital; R, an arbitrary organic substituent.

MacMillan, *Science* **2007**, 316, p. 582-585

**Iminium catalysis:** Lowers energy of enone/enal substrate LUMO; activation towards conjugate additions , Friedel-Crafts alkylation, etc.

**Enamine catalysis:** Raises energy of substrate HOMO; activation towards attack by electrophiles

**SOMO catalysis:** A radical cation with an activated singly occupied molecular orbital  
→  $\alpha$ -functionalisation of aldehydes with weak nucleophiles via radical trapping

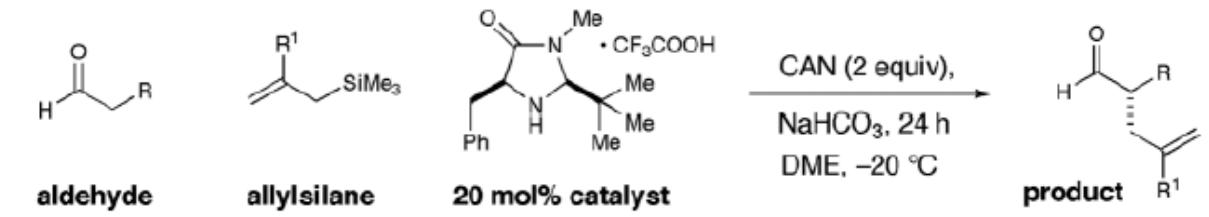

**Fig. 2.** (A) Catalytic chemical steps leading to formation of the SOMO-activated intermediate. Me, methyl; Ph, phenyl. (B) DFT-calculated three-dimensional structure of the enantio-differentiated radical cation. (C) Possible transformations arising from enantioselective organocatalytic SOMO catalysis.

MacMillan, *Science* **2007**, 316, p. 582-585

- Formation of a  $3\pi \text{ e}^-$  radical cation with a singly occupied molecular orbital via  $1 \text{ e}^-$  oxidation of the enamine
- $3\pi \text{ e}^-$  system projected away from bulky *tert*-butyl group
- Selective population of *E* configuration to minimize non-bonding interactions with the imidazolidinone ring

**Table 1.** Representative SOMO catalysis. Enantioselective aldehyde  $\alpha$ -allylation is shown. Bz, benzoyl; Boc, *tert*-butyl carbamoyl; Et, ethyl.

entry	aldehyde	product*	entry	aldehyde	product†
1			4		
2			5		
3			6		

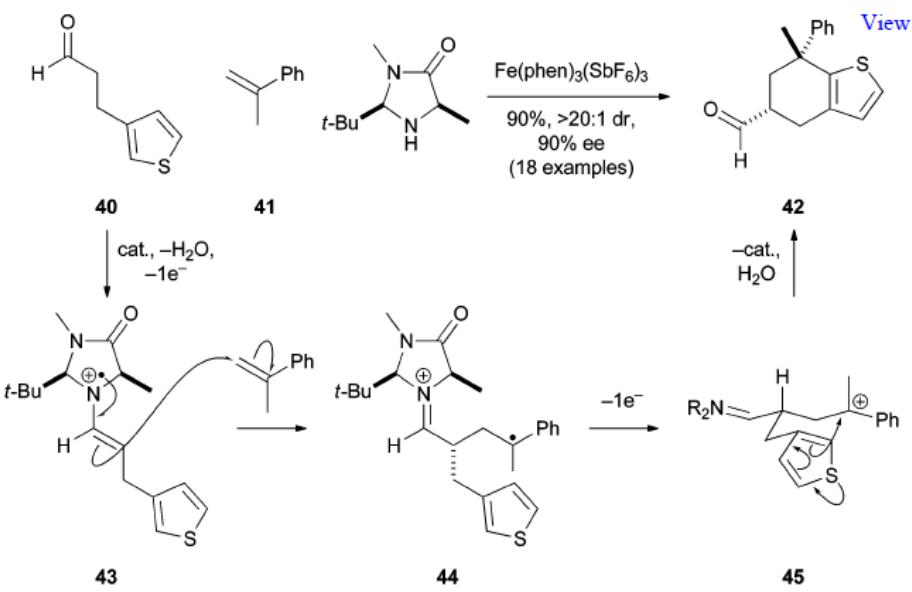

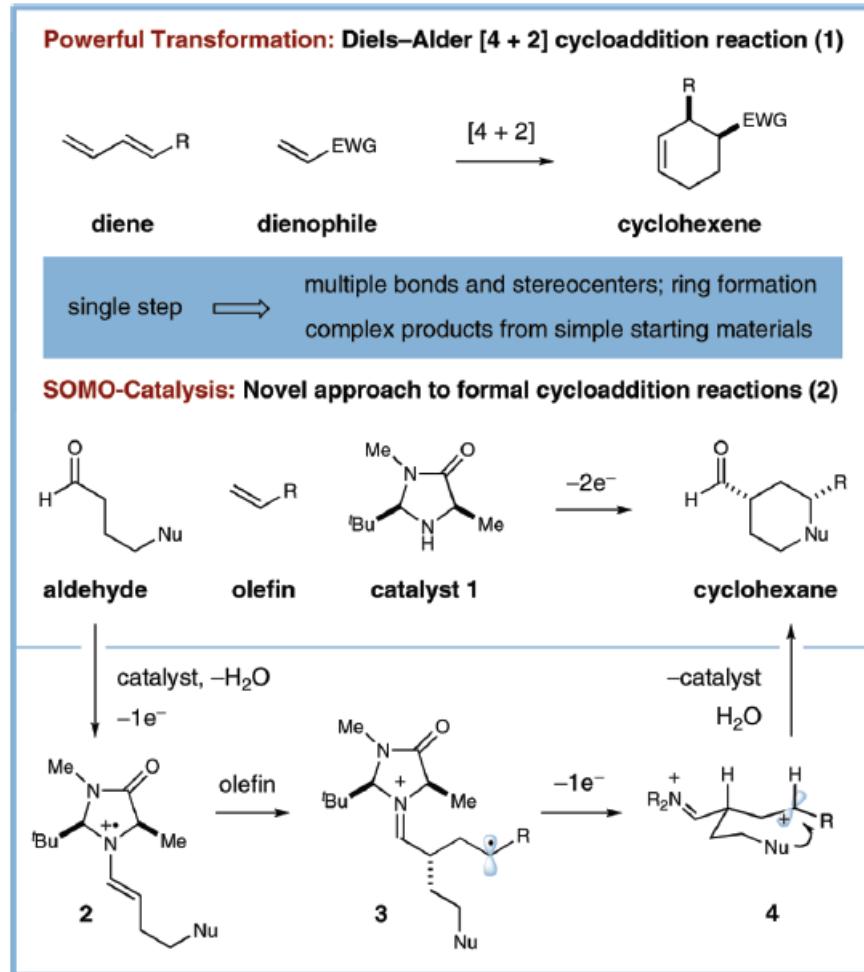

- Good functional group tolerance (olefins, ketones, esters, carbamates...)

- A diverse array of allylsilanes can be used

MacMillan, *Science* **2007**, 316, p. 582-585

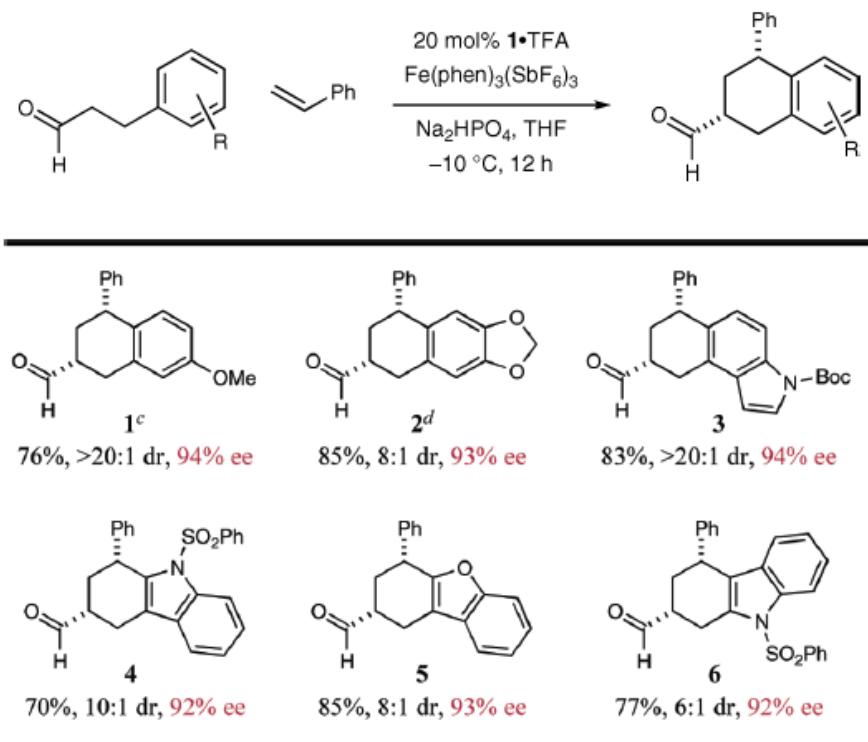

- Enolation: MacMillan, *J. Am. Chem. Soc.* **2007**, 129, 7004  
 Vinylation: MacMillan, *J. Am. Chem. Soc.* **2008**, 130, 398  
 Arylation: MacMillan, *J. Am. Chem. Soc.* **2009**, 131, 11640  
 Carbo-oxidation: MacMillan, *J. Am. Chem. Soc.* **2008**, 130, 16494

# Enantioselective cascade cycloadditions

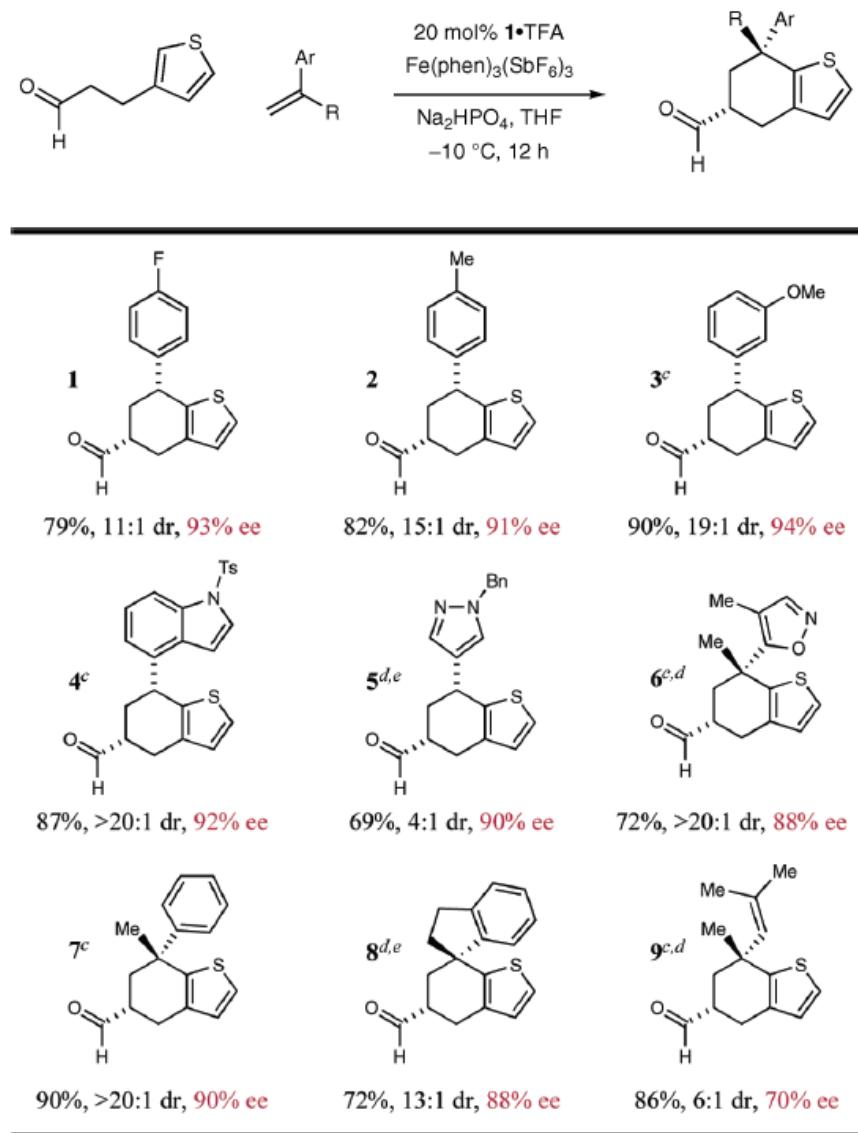

- Direct and selective access to complex cyclohexyl motifs
- Simple aldehyde and olefin substrates
- Catalyst mediated
- Highly predictable with respect to regio-, diastereo-, and enantiocontrol

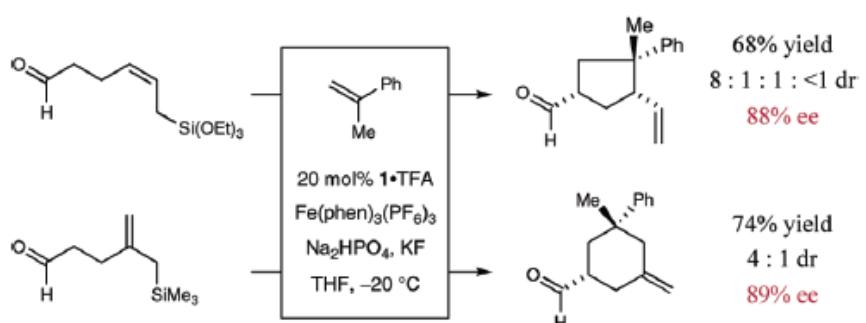

**Table 2.** Enantioselective SOMO-Cycloaddition: Arene Scope<sup>a,b</sup>

**Table 3.** Enantioselective Cascade Cycloaddition: Olefin Scope<sup>a,b</sup>

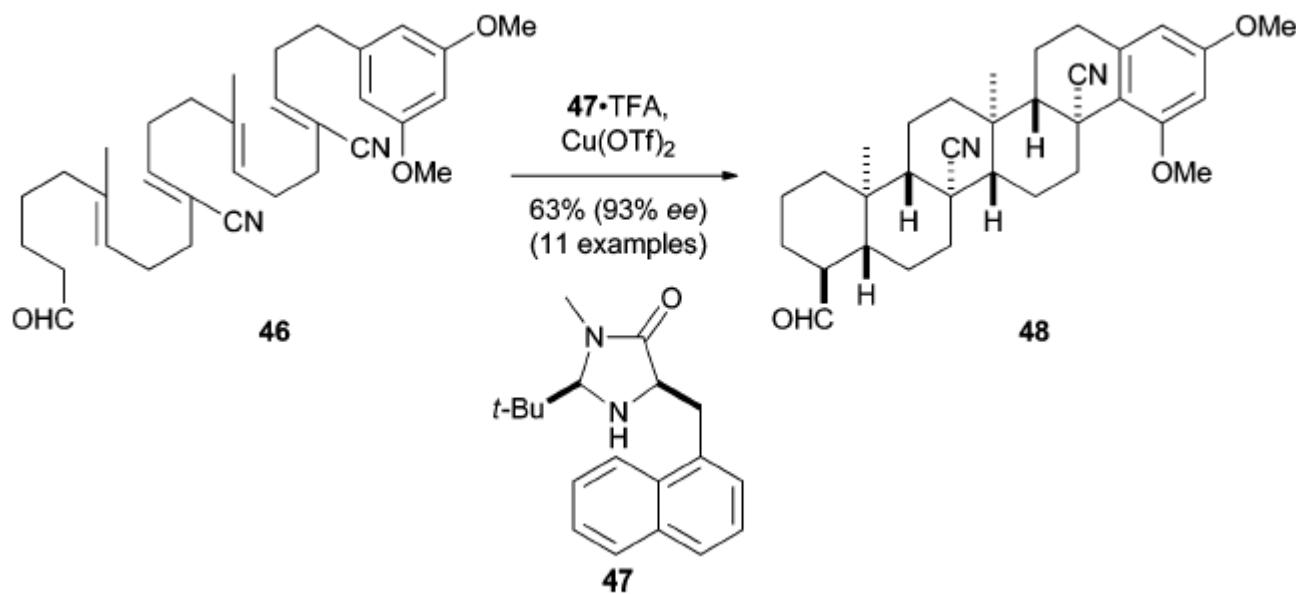

(3 + 2) and (4 + 2) Cascade Cycloadditions Via Allyl Silanes (eqs 3 & 4)

<sup>a</sup> Results listed as product, yield, diastereomeric ratio (dr), enantiomeric excess (% ee). <sup>b</sup> Diastereomeric ratio, % ee determined as in Table 1. <sup>c</sup> Reaction conducted at -20 °C. <sup>d</sup> Reaction performed with Fe(phen)<sub>3</sub>(PF<sub>6</sub>)<sub>3</sub> as oxidant. <sup>e</sup> Reaction conducted at -40 °C.

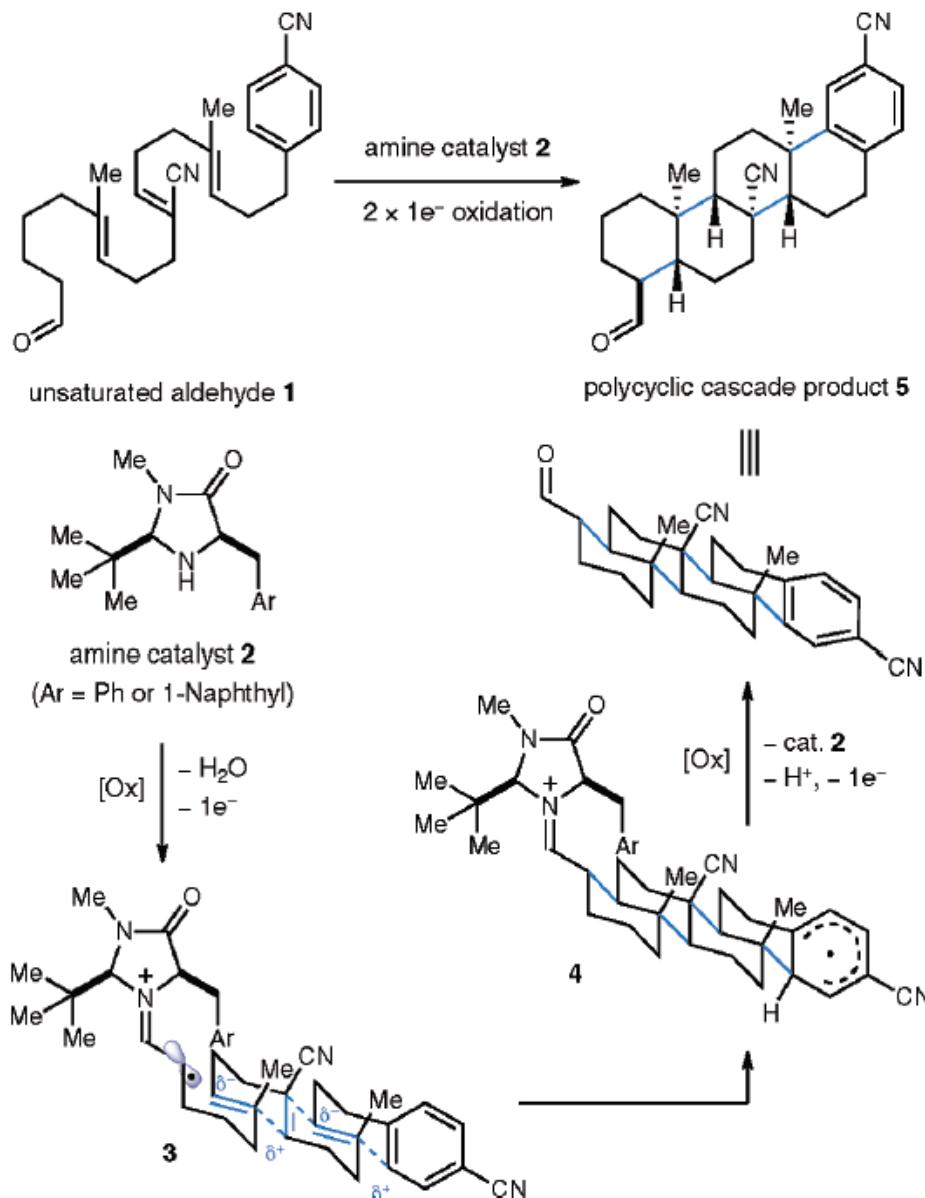

# Polyene Cyclization

MacMillan, *J. Am. Chem. Soc.*, **2010**, 132, 5027

*A new application of SOMO catalysis to the enantioselective construction of multiple C-C bonds and contiguous stereocentres in the context of steroidal and terpenoidal architecture*

**Scheme 1.** Enantioselective Polycyclization via SOMO Catalysis

- Formation of  $\alpha$ -imino radical **3**
- Series of *6-endo-trig* cyclizations
- Termination by a suitable arene  
→ cyclohexadienyl radical **4**
- Second oxidation step  
→ cyclohexadienyl cation
- Rearomatization
- Liberation of catalyst  
→ Pentacycle **5**

**Electronic properties of tethered polyene:  
alternating sequence of polarity-inverted  
C=C bonds (acrylonitrile and isobutene  
moieties)**

# Bi-and Tricyclization

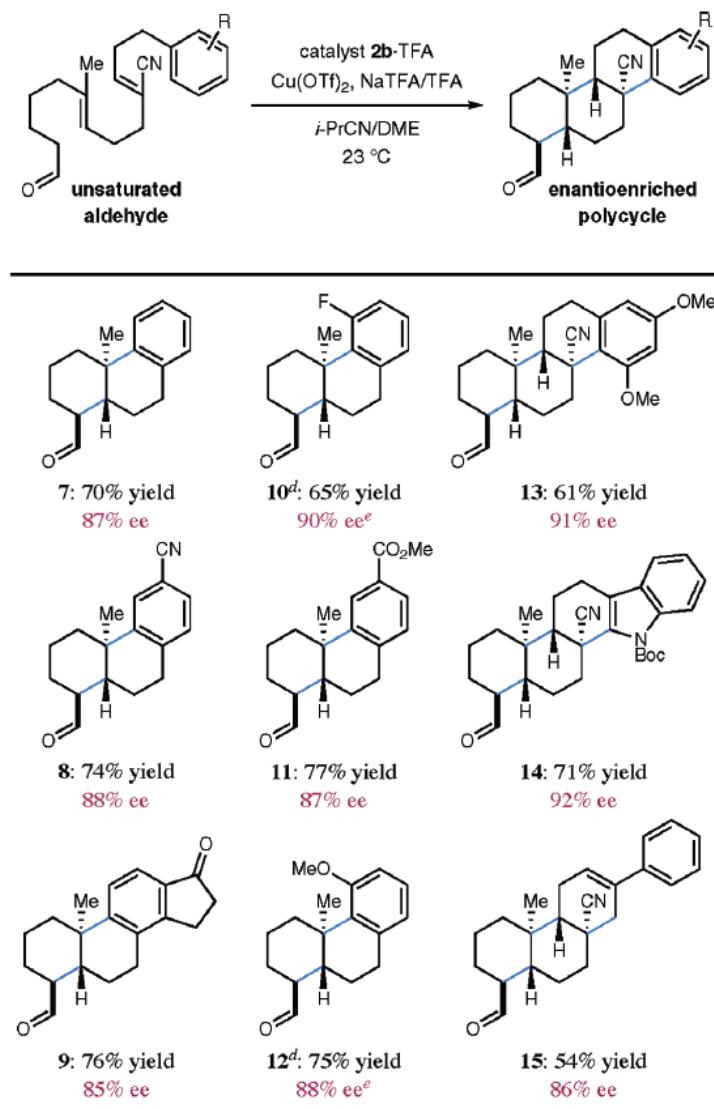

**Table 1.** Reaction Optimization for Enantioselective Bicyclization<sup>a</sup>

entry	catalyst	additive <sup>b</sup>	solvent	yield (%) <sup>c</sup>	ee (%) <sup>d</sup>
1	2a, Ar = Ph (20 mol%)	none	MeCN	11	34
2	2a, Ar = Ph (20 mol%)	TFA	MeCN	16	35
3 <sup>e</sup>	2a, Ar = Ph (20 mol%)	TFA	MeCN	42	42
4 <sup>e</sup>	2b, Ar = 1-Np (20 mol%)	TFA	MeCN	56	74
5 <sup>e</sup>	2b, Ar = 1-Np (20 mol%)	TFA	<i>i</i> -PrCN/DME <sup>f</sup>	54	87
6 <sup>e</sup>	2b, Ar = 1-Np (30 mol%)	TFA	<i>i</i> -PrCN/DME <sup>f</sup>	70	87

<sup>a</sup> Reactions were performed on a 0.20 mmol scale using 2.5 equiv of Cu(OTf)<sub>2</sub> and 2.0 equiv of NaTFA. <sup>b</sup> Using 3.0 equiv of TFA. <sup>c</sup> Isolated yield. <sup>d</sup> Determined by chiral HPLC analysis. <sup>e</sup> With slow addition of oxidant and base as a solution in MeCN or *i*-PrCN. <sup>f</sup> A 3:2 *i*-PrCN/DME mixture (0.08 M).

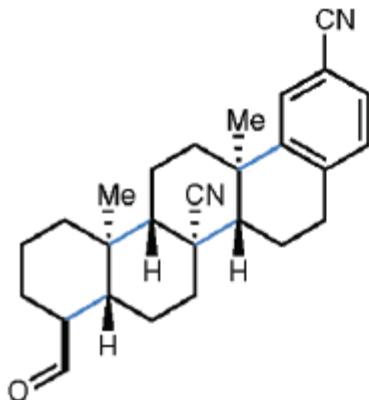

MacMillan, *J. Am. Chem. Soc.*, 2010, 132, 5027

**Table 2.** Scope Studies in Enantioselective Bi- and Tricyclization<sup>a,b,c</sup>

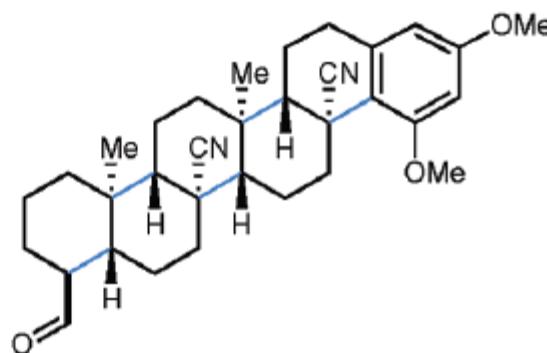

<sup>a</sup> Conditions: Slow addition (7 h) of Cu(OTf)<sub>2</sub> (2.5 equiv), NaTFA (2.0 equiv), and TFA (3.0 equiv) in *i*-PrCN (2 parts) to aldehyde and catalyst (30 mol %) in 1:2 *i*-PrCN/DME to give a 0.08 M solution with subsequent stirring for 17 h at room temperature. <sup>b</sup> Isolated yield. <sup>c</sup> ee was determined by chiral HPLC analysis. <sup>d</sup> Ortho/para mixture (4:1 for 10; 2:1 for 12). <sup>e</sup> ee of the ortho product; 91% ee for the para regiosomer of 12.

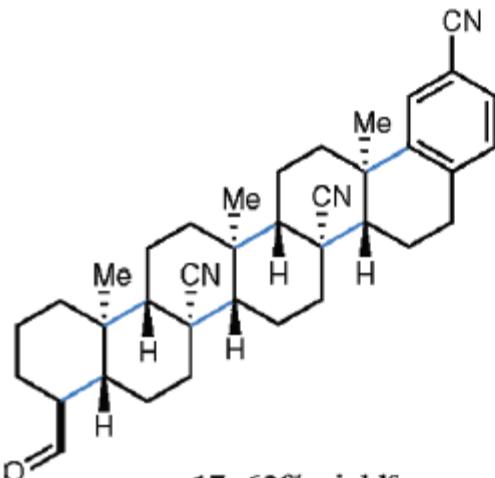

**Scheme 2.** Extended Ring Systems by Organo-SOMO Catalysis<sup>a</sup>

**5:** 56% yield, 92% ee<sup>b</sup>

**16:** 63% yield, 93% ee<sup>b</sup>

**17:** 62% yield<sup>c</sup>

6 new C–C bonds  
11 contiguous stereocenters  
5 all-carbon quaternary stereocenters  
92% yield per bond formation

<sup>a</sup> Conditions: See Table 2, footnotes *a*–*c*. <sup>b</sup> Determined by chiral supercritical fluid chromatography (SFC). <sup>c</sup> Determination of enantiomeric excess in this case was not possible because of the sparing solubility of the polycycle in HPLC or SFC solvents:  $[\alpha]_D = -25.3$  ( $c = 0.68$ ,  $\text{CHCl}_3$ ); also see ref 22.
